CONCRETE MIXER

This human-powered concrete mixer is a bit of a mystery. We have no information about it, apart from the "Rota Mix" marking on it. It is constructed with a steel pipe frame and a sheet steel barrel.

In use it is loaded with cement, sand and gravel, the lid is secured, and the mixer rolled along the ground to tumble and mix the contents. Then the water is added and the mixer is rolled to where ever the concrete is needed. The barrel can pivot to unload the concrete to either side. No wheelbarrow is required.

A simple, elegant design with a small carbon footprint.
